Colloquium on air pollution

The research center [CRPGL](#) (Centre de Recherche Public Gabriel Lippmann) organizes the 12th Nov. 2008 a conference on indoor and outdoor air pollution. I will present a poster covering 10 years ground ozone measurements done at meteoLCD. All trends are negative, there are some interesting correlations with other parameters. I will post a pdf version after the conference on the meteoLCD site in the "Papers" chapter.

Just a preliminary remark: It seems that biogenic (natural occurring) VOC's (like isoprenes and terpenes emitted from trees) are largely understated, and may play a major (if not a dominant) role in summer ozone peaks at rural stations like Diekirch.

 [Comment](#)  [Reblog](#)  [Subscribe](#) 

The Royal Society just published a big [report](#) "Ground-level ozone in the 21st century: future trends, impacts and policy implications". Regardless the bettering at many European locations, the overall tone is alarmist (like: the heat wave 2003 shows what will become the rule...). As Richard Lindzen always says: Alarm seems to be mandatory to get attention and funding.
